**otoole** is a Python package which provides a command-line interface for users of OSeMOSYS.

The aim of the package is to provide a community resource which centralises the commonly used pre- and post-processing steps around the use of OSeMOSYS.

**otoole** aims to support different ways of storing input data and results, including csv files, databases, datapackages and Excel workbooks, as well as different implementations of the OSeMOSYS model.

# CHAPTER 1

---

## Getting Started

---

Install otoole using pip:

```
pip install otoole
```

Obtain the latest version of OSeMOSYS:

```
otoole setup osemosys
```

Download an OSeMOSYS datapackage and convert it to a modelfile:

```
otoole prep datafile http://github.com/KTH-dESA/model\_library/simplicity/datapackage.  
→ json ./simplicity.txt
```

Run OSeMOSYS with the modelfile and place the results in a folder:

```
otoole run --modelfile simplicity.txt --datapackage results
```

## 2.2 Contributors

- Will Usher <[wusher@kth.se](mailto:wusher@kth.se)>

## 2.3 Changelog

### 2.3.1 Version 0.1

- Add CPLEX to csv or CBC solution file conversion script

- Create CSV files in a folder from an excel workbook
- Create a Tabular Data Package from a folder of CSVs
- Create an OSeMOSYS datafile from a Tabular Data Package
- Adds a command line interface to access these tools

## 2.4 otoole

### 2.4.1 otoole package

#### Subpackages

otoole.preprocess package

#### Submodules

otoole.preprocess.create\_datapackage module

otoole.preprocess.excel\_to\_osemosys module

otoole.preprocess.longify\_data module

otoole.preprocess.narrow\_to\_datafile module

#### Module contents

otoole.results package

#### Submodules

otoole.results.convert module

Converts an OSeMOSYS solution file from CPLEX, CBC or GLPK into CBC or CSV format

**class** otoole.results.convert.**ConvertLine** (*data: List[T], start\_year: int, end\_year: int, output\_format='cbc'*)

Bases: `object`

Abstract class which defines the interface to the family of convertors

Inherit this class and implement the `_do_it()` method to produce the data to be written out into a new format

#### Example

```
>>> cplex_line = "AnnualCost          REGION  CDBACKSTOP          1.0          0.0          └"
↳137958.8400384134"
>>> convertor = RegionTechnology()
>>> convertor.convert()
```

(continues on next page)

(continued from previous page)

VariableName (REGION, TECHCODE01, 2015)	42.69	0\n
VariableName (REGION, TECHCODE01, 2017)	137958.84	0\n

**convert** () → List[str]**convert\_cbc** () → List[str]

Format the data for writing to a CBC file

**convert\_csv** () → List[str]

Format the data for writing to a csv file

**class** otoole.results.convert.**RegionTechnology** (*data: List[T], start\_year: int, end\_year: int, output\_format='cbc'*)

Bases: *otoole.results.convert.ConvertLine*

**class** otoole.results.convert.**RegionTimeSliceTechnologyMode** (*data: List[T], start\_year: int, end\_year: int, output\_format='cbc'*)

Bases: *otoole.results.convert.ConvertLine*

**otoole.results.convert.convert\_cplex\_file** (*cplex\_filename: str, output\_filename: str, start\_year=2015, end\_year=2070, output\_format='cbc'*)

Converts a CPLEX solution file into that of the CBC solution file

**Parameters**

- **cplex\_filename** (*str*) – Path to the transformed CPLEX solution file
- **output\_filename** (*str*) – Path for the processed data to be written to

**otoole.results.convert.process\_line** (*line: str, start\_year: int, end\_year: int, output\_format: str*) → List[str]

Processes an individual line in a CPLEX file

A different ConvertLine implementation is chosen depending upon the variable name

**Parameters**

- **line** (*str*) –
- **start\_year** (*int*) –
- **end\_year** (*int*) –
- **output\_format** (*str*) – The file format required - either csv or cbc
